Docket No. 99N-1307

Dear Sirs,

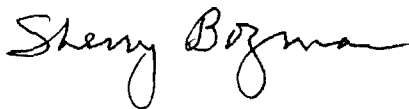

It has come to my attention that there is an SE vaccine on the market that has shown great results in controlling SE in table eggs. Why is this not part of your recommendation for food safety? It seems to me that this control method would be more useful than another unread label on a carton. Maybe if the eggs came from SE vaccinated birds, the label would not be required.

I do think the refrigeration and continued education regarding handling is good.

As a consumer, I have to ask myself why the layer industry is not vaccinating to protect their eggs and to avoid liability claims. Risk reduction is less costly than being sued.

Thank you,

Sherry Bozman
Consumer
